available.**

Your Doctor has requested that you have an ultrasound of the scrotum.

Ultrasound uses high frequency sound waves to generate an image and there are no known side effects. The image is in real time and can show structure and movement of internal organs including blood supply.

This test is usually performed if you have pain or have concerns regarding a lump or swelling. You will be asked to point out the area of concern to aid the examiner while you are being scanned.

The scan will assess the –testes

Epididymus

Scrotal wall

Spermatic cord

Blood supply

Questions regarding relevant history such as vasectomy will be asked as it helps interpret the images. You will be asked to lie down so that a probe coupled with hypo allergenic gel can be placed over the skin of the area being scanned. The scrotal sac and contents are scanned imaged and documented. This is not normally uncomfortable, and your privacy will be respected.

You may request a chaperone if desired, privacy will be respected at all times.

The recorded images will be interpreted by the Radiology Doctor and a report will be sent to your referring doctor.
